ResQTh

Intelligent emergency response and post-incident action guide for Thailand

purpose , scope and out of scope

Purpose

- **to develop an AI-assisted emergency information system**
- **to quickly access reliable emergency resources and actionable guidance based on their location and situation.**
- **high-urgency crises** *(offering one-tap contact and immediate assistance cards)*
- **low-urgency post-incident scenarios** *(offering step-by-step checklists and facility navigation)*

MVP Scope

- **focused on four core functional user stories:**
- *detecting location (FR-1)*
- *select an emergency category (FR-2)*
- *Display the information, including relevant facilities and link to direction (FR-3)*
- *Natural-Language emergency search (FR-4)*
- *Share live location with a trusted contact, with user-controlled stopping and link expiration (FR-5)*
- *Find nearby emergency facilities (FR-6)*

Out of Scope

- *Keep out group chat or messaging inside the app.*
- *Exclude any payment or subscription feature.*
- *Display any ads-related information such as private hospitals or services*
- *Give medical treatment instruction*
- *Direct automated dispatching of police or medical units (the app provides one-tap phone calls and GPS sharing, but does not auto-dispatch responders)*

Users & Stakeholders

Who we serve and what they need from ResQTh

Foreign Residents / Visitors In Thailand

NEED

Emergency contact, information, and guidelines in English.

FEAR

Confusion or navigating to the wrong place during a crisis, not knowing what to do.

Type

Primary user

Emergency Operators/ Dispatchers

NEED

Assurance that the AI-assisted system provides only verified contacts and information from the database.

FEAR

Foreigners calling the wrong department because the system misinterpreted their request.

Type

Secondary stakeholder

Users & Stakeholders

Who we serve and what they need from ResQTh

Trusted contacts

NEED

Need access to a live location-sharing link with clear status indicating whether sharing is active, stopped, or expired.

FEAR

Feared of unauthorized access to the link or unclear sharing status.

Type

Secondary users

Technical Team/ Data Provider

NEED

Clear data boundaries and reliable database emergency database management.

FEAR

System outage during critical queries or unauthorized data manipulation and data leakage.

Type

Institution or supplier

Functional Requirements

Solving specific user pains through FRs

FR-1

Detect user's location

Identify current province automatically or let user set it manually.

Pain: In an emergency, users often do not know their exact province or cannot spell local Thai location names accurately under stress.

FR-2

Select emergency category

Filter options by specific incident categories (Medical, Police, Lost Passport).

Pain: Panic during emergencies makes reading through unstructured lists difficult, while choosing the wrong department causes dangerous delays in getting help.

FR-3

Display the information

Present contact details and action tools tailored to the urgency level.

Pain: Users struggle to navigate static lists during panic, whereas post-incident scenarios require procedural guidance rather than just phone numbers.

FR-4

Add via Natural-language (AI assisted)

Entering a natural-language query so the system can identify the emergency category, location, and urgency level automatically.

Pain: Foreigners do not know local emergency classification terms or which specific department handles their scenario

Functional Requirements(Cont.)

Solving specific user pains through FRs

FR-5

Share live location with a trusted contact

Pain: A trusted contact may not know where the user is or whether a previously shared location is
still up to date.

FR-6

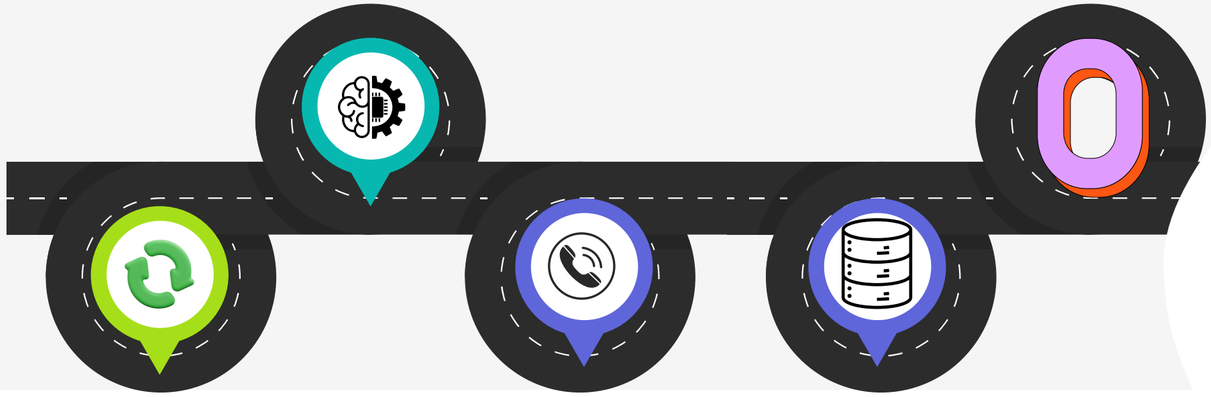

Find nearby emergency facilities

Pain: Users unfamiliar with their surroundings may not know where to find the nearest hospital,police station, or other relevant emergency facility.

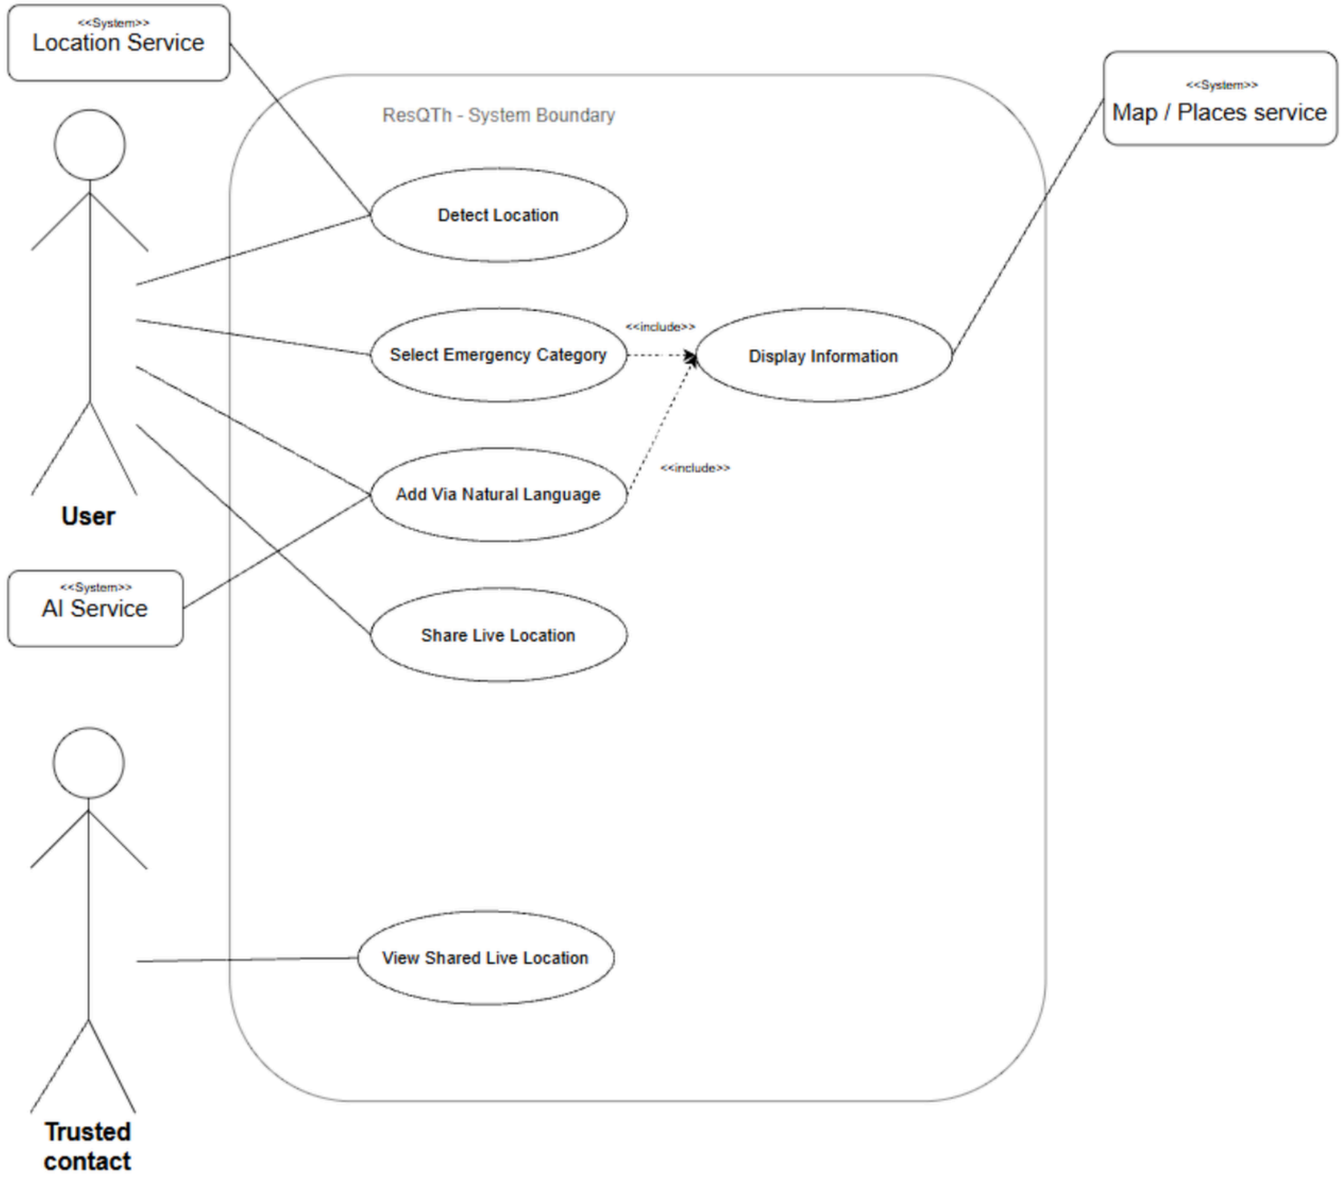

Non-Functional Requirements

Measurable targets for performance, reliability, and security

ID	Statement (Testable)	How we will check
NFR-1	Action interfaces render in under 3 seconds.	*Stopwatch on laptop, 3 trials.*
NFR-2	AI feature parses and redirects within 4 seconds.	*Measure API response time.*
NFR-3	First-time user finds hotline in under 20 seconds.	*Timed trial with new user.*
NFR-4	Offline database displays hotlines if network fails.	*Disconnect device and verify.*
NFR-5	Zero storage of location/queries tied to PII.	*Audit server logs and storage.*

Use-case Diagram

AI Log

Date	Tool / model	What we asked	What AI produced	What we changed / verified	What we learned
18 Aug 2026	Gemini	Emergency information website for both locals and foreigners that has any name that is easy to remember and shorter	. safebridge . ResQ	Added “Th” at the end of “ResQ” as we wanted to represent our services in Thailand	
23 Aug 2026	Gemini	Draft our scattered thoughts and ideas into structured sections that align with the provided project layout. (we provided our ideas)	Updated SRS document sections matching exact course structure.	-Edit stakeholder, Technical team need and what they fear -Updated FR, NFR section to align with our project scope -Update the constraints of our concern -Edit use case of our preference	-how to layout our requirements and preferences in our project -how to use Ai to draft our ideas and modify it according to our project requirements and do the review
4 Sep	ChatGPT	Check any typo errors in our documents	Parts where I am having typo errors	-We scanned the document again and check pointed areas if the errors were really there and fixed what was needed	how to use AI as a tool on time-consuming and tedious tasks, and we verify the results as humans
